ABOUT US

BM Crane Machine Automation, under the leadership of our founder Mehmet SUMAR, started its operations in Adana and has adopted the principle of using past experience and modern technologies, and has added many products to its service with this understanding to this day.

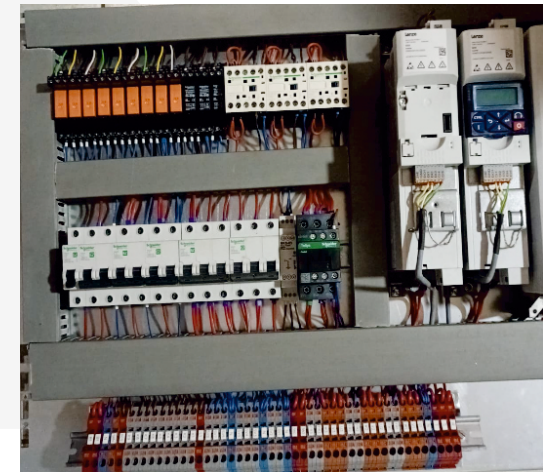

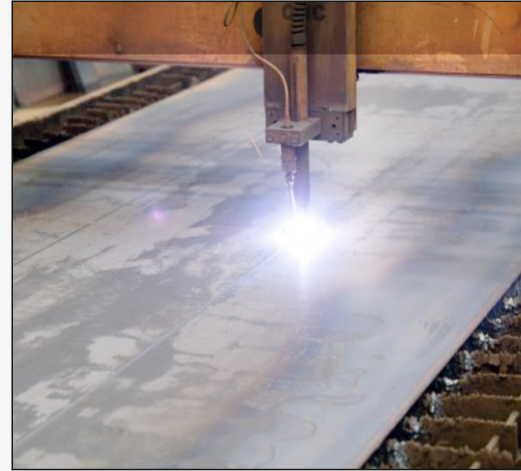

Production Subject: BM, which works on various capacities (from 500kg to 300,000kg) electric cranes, portal cranes, walking reducers, carrier steel constructions, mobile bridge ceiling cranes, bucket container cranes, special design cranes; It produces cranes of world quality for its customers with crane control equipment and spare parts.

Today, BM Crane, with the service principle where customer satisfaction is prioritized, has adopted quality as a way of life and continues its work to leave permanent works by creating differences in the tasks it undertakes with our expert staff in the field.

As BM Crane, we will continue to contribute to the contemporary and modern Turkish economy, to produce cranes at world standards and to create values for our developing country.

DOUBLE GIRDER MOBILE BRIDGE CRANE

Double girder mobile bridge cranes are also known as double girder overhead cranes. The bridge consists of two parts and the lifting group is a top-running system. Double girder mobile bridge cranes can allow higher lifting capacities compared to single girder mobile bridge cranes

MONORAIL CRANE

Monorail cranes are cranes that operate suspended from mounted profiles or single girder bridges on the ceiling. They can be used as 4-motion or 6-motion. They are preferred due to their practicality and speed.

PORTAL CRANE

These cranes are preferred for lifting applications in both open and enclosed spaces. The bridge sections of the crane are supported by portal legs, and these portal legs, along with the bridge running gear, are fixed to the ground and move along a runway track system.

HALF GANTRY CRANE

Half gantry cranes are preferred for use in enclosed spaces, either beneath existing mobile bridge cranes or alongside building facades in open areas. In enclosed spaces, particularly in factories engaged in high-volume production, where frequent load transfers are required, they can operate in different directions within the same bay using additional side tracks and feeding lines. In open areas, they allow for uninterrupted operation while transferring loads without obstructing the production line.

JIB CRANE

Jib cranes are used for lifting, transporting, and stacking loads within a specific radius from a fixed point. They enable various types of applications to be carried out.

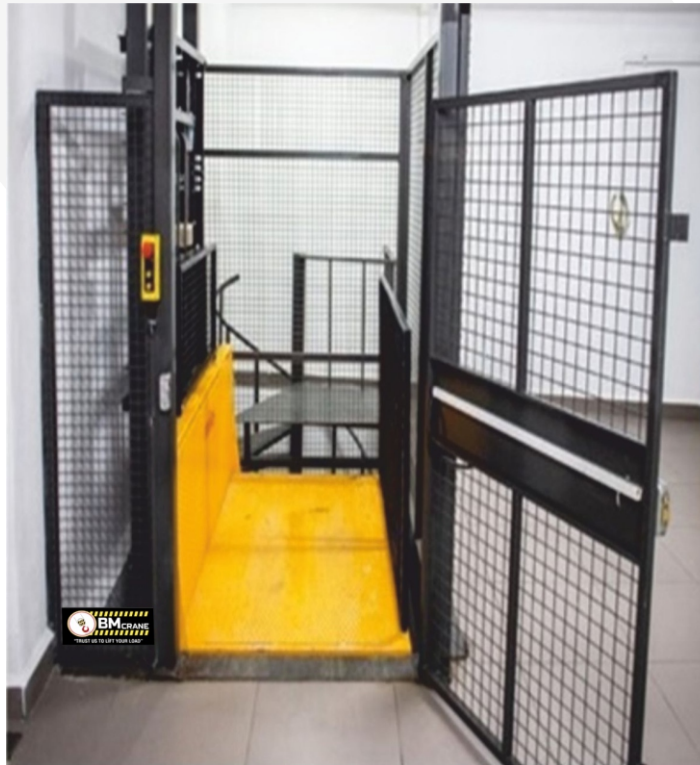

TRANSFER CART

Transfer carts are used to move a load horizontally on a flat surface. They facilitate the transfer of loads between multiple bays in industrial settings where multiple bays are present.

Wire rope hoists are used for the purpose of lifting loads in both enclosed and open areas, with a travel distance ranging from ten to thirty meters. They operate with a double drum hoist machine. They are capable of carrying loads up to an average of 10,000 kg
